

## Evaluation of embryo morphology

Inge Agerholm, MSc, Ph.D  
Fertility Clinic Brødstrup, Denmark  
inge.e.agerholm@horsens.rm.dk

---

---

---

---

---

---

---

---

## Evaluation of Embryo Morphology Why

- Evaluation of Embryo Morphology is an evaluation of **Embryo Quality**

---

---

---

---

---

---

---

---

## Evaluation of Embryo Morphology How

- Embryo evaluation is mostly done in light microscopy at 200 – 400 x magnification

---

---

---

---

---

---

---

---

## Evaluation of Embryo Morphology When

- Embryos should be evaluated at **fixed time intervals**

---

---

---

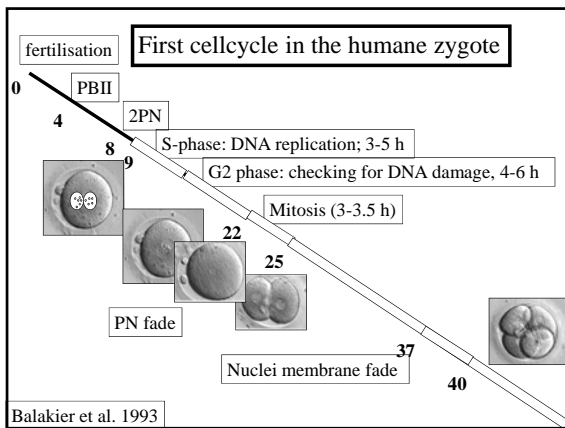

---

---

---

---

---

---

---

---

---

---

---

---

---

## Evaluation of Embryo Morphology

- Developmental timing of the embryo is the **most important** parameter.

---

---

---

---

---

---

---

---

## Evaluation of Embryo Morphology What

- Parameters indicating developmental timing
- Parameters indicating for chromosome failure or degeneration

---

---

---

---

---

---

---

## Parameters indicating timing

- **Parameters:**  
Number of blastomer  
at certain timepoints

---

---

---

---

---

---

---

## Parameters indicating timing

- **Parameter:**  
Presence of nuclei  
at certain timepoints

---

---

---

---

---

---

---

Number of blastomeres  
Early cleavage

---

---

---

---

---

---

---

---

Early Cleavage

---

---

---

---

---

---

---

---

Early Cleavage  
IVF vs ICSI

- **Lundin et al 2001 found that**  
*EC after 25-27 in ICSI embryos was an independent predictor for live birth.*

---

---

---

---

---

---

---

---

## Early Cleavage Agonist vs Antagonist

- Yan et al. 2009 found that:

*The Early Cleavage (EC) rate was significantly lower in the GnRH antagonist group compared to the GnRH agonist group.*

*In the GnRh agonist group the EC embryos resulted in significantly higher pregnancy (PR) rates than the late-cleaved embryos.*

*In the GnRH antagonist group there was no difference in PR between EC and late-cleaved embryos*

---

---

---

---

---

---

---

---

## Developmental timing

- The timing of a cell cycle express the conditions of the cell.
- Number of blastomeres at certain time points express the timing of the cell cycles in the individual embryo.

---

---

---

---

---

---

---

---

## Number of blastomeres and implantation

- Ziebe et al. 1997 showed that

*Four cell embryos on day 2 had significant higher implantation rate compared to two and three cell embryos*

---

---

---

---

---

---

---

---

## Number of blastomeres and blastocyst formation

**Alikani et al. 2000 describe that**  
*the proportion of normal appearing blastocysts was significantly higher among embryos with 7-9 cell at day 3 compared to < 7 or > 9 cells.*

---

---

---

---

---

---

---

---

## Number of blastomeres and Aneuploidy

• **Magli et al 2001, 2007 found that:**  
*The incidence of aneuploidy was highest among embryos that were 3-4 or 5-6 cells day 3 compared to embryos that were 7-8 cells.*  
*The incidence of aneuploidy was also higher in embryos with more than 9 cells day 3.*

---

---

---

---

---

---

---

---

## Number of blastomeres and Aneuploidy

\* $P < 0.001$   
\*\* $P < 0.025$

*"These observations suggest that timing is a crucial factor in determining embryonic development. In agreement with previous observations, any deviation from the expected cleavage stage has dramatic effects on implantation."*

M.C. Magli, Italy

---

---

---

---

---

---

---

---

### Number of blastomeres and early pregnancy loss

- **Hourvitz et al. 2006, found that**  
*five or less blastomeres in the best embryo transferred at day 3 were predictive for early pregnancy loss.*

---

---

---

---

---

---

---

---

### Presence of nuclei

- **Palmstierna et al. demonstrated in 1998 that**  
*visible mononucleated blastomeres are a strong predictor of pregnancy in IVF treatment.*
- **Saldeen et al. 2005 confirmed that**  
*the presence of a single nucleus in each of the blastomeres in a 4 cell embryo day 2 is predictive for implantation.*

---

---

---

---

---

---

---

---

### Presence of nuclei

- **Hnida et al 2007 found that.**  
*2 cell embryos with no visible nuclei day 2 (44 h after fertilization) were closer to the next cell cycle than 2 cell embryos with visible nuclei.*

---

---

---

---

---

---

---

---

### Presence of nuclei

- **Lemmen, Agerholm and Ziebe (2008)** has demonstrated that

*Synchrony in re-appearance of nuclei after first cell division is significantly associated with pregnancy success.*

Time-lapse

---

---

---

---

---

---

---

---

### Nuclei size

- **Agerholm et al. 2008** found that:

*Nuclei with loss of chromosomes are smaller than nuclei with gain of chromosomes ( $p < 0.01$ , 95 % CI -2.92 – (-0.68)).*

---

---

---

---

---

---

---

---

### Bi or multinucleation

- **Jackson et al. 1998, Pelinck et al. 1998 and Van Royen et al. 1999** states that

*The presence of two or more nuclei in at least one blastomere is correlated to low implantation rates.*

---

---

---

---

---

---

---

---

Binucleation and chromosome status

- **Agerholm et al. 2008 found that :**  
*Nuclei from binucleated blastomeres are more often chromosomal abnormal than nuclei from mononucleated embryos.*  
*(P < 0.01)*

---

---

---

---

---

---

---

---

Binucleation and blastomer size

- **Agerholm et al. 2008 also found that:**  
*Binucleated cells > than mononucleated cells from mononucleated embryos*  
*(p = 0.048, 95% CI 0.60 - 7.1)*  
*Binucleated cells > end mononucleated cells from binucleated embryos*  
*(p = 0.03, 95% CI 0.59 - 9.22)*

---

---

---

---

---

---

---

---

Binucleation and Chromosome status

- **Ziebe et al 2003 found:**  
*a significantly increased rate of chromosomal abnormality for embryos containing unevenly sized blastomeres*
- **Hardarson et al 2001 also indicate that:**  
*Embryos with unevenly sized blastomeres correlate with increased rates of multinucleation*

---

---

---

---

---

---

---

---

### Fragmentation and implantation

- **Gioretti et al. 1995 and Van Royen et al. 1999 have found that**

*High amounts of fragmentation correlates negatively with implantation and pregnancy*

- **Ziebe et al 2003 found that**

*Degree of Fragmentation correlates with chromosome abnormality day 3 but not day 2.*

---

---

---

---

---

---

---

---

### Blastomer size and chromosome status

- **Hardarson et al. 2001, Ziebe et al. 2003, Agerholm et al 2008 found that**

*Embryos with uneven sized blastomeres had a significantly higher proportion of blastomeres with abnormal chromosome complement*

---

---

---

---

---

---

---

---

### Embryo appearance and Chromosome status

- **Ziebe et al 2003 found**

*No correlation between localization of the fragment and chromosome abnormality in the embryo.*

*No correlation between cytoplasm appearance and chromosome abnormality in the embryo.*

---

---

---

---

---

---

---

---

### Evaluation of Embryo Morphology

- Can you use all these information's?
- Can you go home and use the time points in your own lab ?
- Can you go home and use the morphology ?

---

---

---

---

---

---

---

---

?

---

---

---

---

---

---

---

---

### Evaluation of Embryo Morphology Why

- Definitions**
- We must use the same definitions for the different parameters

---

---

---

---

---

---

---

---

## Number of blastomeres When

### Standardization:

- We have to be sure that we are evaluating at the same development

---

---

---

---

---

---

---

## Number of blastomeres

- When

---

---

---

---

---

---

---

## Fragmentation volume

---

---

---

---

---

---

---

### Localization of the fragments

---

---

---

---

---

---

---

---

### Blastomere size

---

---

---

---

---

---

---

---

### Bi or Multi-nucleated blastomeres

---

---

---

---

---

---

---

---

## Presence of nuclei

- **When**

---

---

---

---

---

---

---

---

## Evaluation of Embryo Morphology

### Standardization

- Same Media same distribution
- Different Media different distribution
- Same stimulation protocol same distribution
- Different stimulation protocol different distribution
- Same temperature same distribution .....ect.

---

---

---

---

---

---

---

---

## Standardization

Three clinics with same embryo scoring system but different media

---

---

---

---

---

---

---

---

## Evaluation of Embryo Morphology

- Remember to drop unpredictable parameters !

---

---

---

---

---

---

---

---

## Evaluation of embryo morphology

We are doing good and we have found a system that enable us to select embryos that in 75 % of the cases are overall chromosomally normal (7 chromosomes)

Ziebe et al. 2003.

---

---

---

---

---

---

---

---

## Evaluation of Embryo Morphology Static evaluation

---

---

---

---

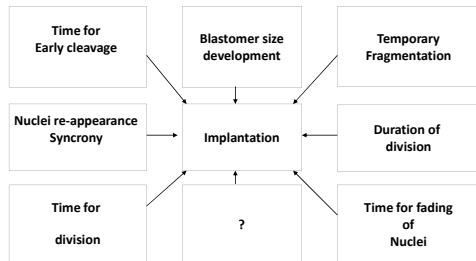

---

---

---

---

## Evaluation of Embryo Morphology Time-Lapse

---

---

---

---

---

---

---

---

## Disclosure

- Beside being labdirector at the Fertility Clinic in Brødstrup I work as clinical coordinator for the company Unisense FertiliTech which have invented an instrument that can do time-lapse evaluation of embryos in a clinical setting.
- I do however also have a time-lapse equipment from Nikon, so the following slides are a mix from both systems.

---

---

---

---

---

---

---

---

## Evaluation of embryo morphology

Can we learn something from Time-lapse

Film

---

---

---

---

---

---

---

---

### Take home message

- Timing in the development is crucial
- Synchrony is important
- Uneven blastomer size is not good and could be a sign for binucleation
- Binucleation is not good but could be dependent on the development
- Fragmentation is temporary
- Presence of nuclei is important but when is crucial

---

---

---

---

---

---

---

---

### Take home message

- FIND your own timing for your parameters in your lab !.....and that goes for Time-lapse and NIR evaluation too !!

---

---

---

---

---

---

---

---
