---

---

---

---

---

---

## Window of Implantation

---

---

---

---

---

---

---

---

## Implantation

---

---

---

---

---

---

---

---

### Factors involved

---

---

---

---

---

---

---

---

### High levels of estradiol

---

---

---

---

---

---

---

---

### LOW IMPLANTATION RATES IN HIGH RESPONDER PATIENTS

- Clinical studies showing low IR in high responder patients (Pellicer et al. Hum Reprod 1995; Simón C et al. Hum Reprod 1995; Pellicer et al. Fertil Steril 1996; Valbuena et al. Hum Reprod 1999)
- Endometrial receptivity but not embryo quality is affected (Simón C et al. Hum Reprod 1995; Valbuena et al. Hum Reprod 1999)
- Evidence of altered endocrine milieu in the periimplantation period (Pellicer A et al. Fertil Steril 1996)
- Increased IR when E2 levels were lower in subsequent cycles (Simón C et al. Fertil Steril 1998; 70:234-9)
- Extremely high E2 levels are embryotoxic for the embryo (Valbuena et al. Fertil Steril 2001)

### LIST OF THE TEN MOST UP- AND DOWN-REGULATED GENES AT hCG+7 versus LH+7

	Name	Fold Change	Functional Category
<b>UP</b>	hypothetical protein FLJ22390	38.87	Unknown
	Tropomyosin C, slow	30.89	Structural protein
	matrix metalloproteinase 26	16.96	Enzyme
	major histocompatibility complex, class II, DR beta	12.23	Immune response
	differentially expressed in hematopoietic lineages	11.89	Inhibitor
	Serine (or cysteine) proteinase inhibitor, clade A (alpha-1 antiproteinase, antitrypsin), member 5	11.88	Inhibitor
	Calpain 6	11.80	Glycoprotein
	Galatinin	11.79	Neuropeptide
	Sorbitol dehydrogenase	11.55	Enzyme
	Branched chain keto acid dehydrogenase E1, beta polypeptide (muple syrup urine disease)	10.12	Enzyme
<b>DOWN</b>	Cartilage oligomeric matrix protein (pseudoachondroplasia, epiphyseal dysplasia 1, multiple)	-58.55	Structural protein
	dipeptidylpeptidase 4 (CD26, adenosine deaminase complexing protein 2)	-31.25	Immune response
	leukemia inhibitory factor (cholestergic differentiation factor)	-23.02	Cytokine
	Mucin 16	-13.61	Membrane protein
	insulin-like growth factor binding protein 1	-11.99	Regulatory protein
	glutathione peroxidase 3 (plasma)	-11.81	Enzyme
	solute carrier family 15 (oligopeptide transporter), member 1	-10.62	Transporter
	pregnancy-associated endometrial protein (placental protein 14, pregnancy-associated endometrial alpha-2-globulin, alpha uterine protein)	-9.43	Secreted protein
	ATP-binding cassette, sub-family C (CFTR/MRP), member 3	-9.38	Transporter
	Calpain 1, basic, smooth muscle	-9.26	Muscle protein

are created equal**

---

---

---

---

---

---

---

---

**Study of the endometrial development in oocyte donors treated with either high- or standard-dose GnRH antagonist compared to treatment with a GnRH agonist or in natural cycles**

**EXPERIMENTAL DESIGN**

Caucasian  
Fertile women with normal cycles  
18-35 years  
body mass index: 19-25 kg/m<sup>2</sup>

Days	Treatment	Biopsies
12	standard-dose ganirelix (Antagonist)	hCG+2 hCG+7
9	high-dose ganirelix (Antagonist)	hCG+2 hCG+7
10	Buserelin (Agonist)	hCG+2 hCG+7
12	Natural cycle	LH+2 LH+7

*Simón et al. Hum Reprod 2005*

---

---

---

---

---

---

---

---

### Aims of the study

- Number of follicles on the day of hCG
- Serum hormone values at different times of the stimulated cycle
- **Endometrial dating of biopsies by Noyes method**
- Expression of Estradiol and Progesterone receptors (immunohst)
- Scanning electron microscopy
- **Genomic studies by microarray**
- Validation of genomic assays by Q-PCR

*Simin et al. (2005) Hum Reprod 12:3318-27*

---

---

---

---

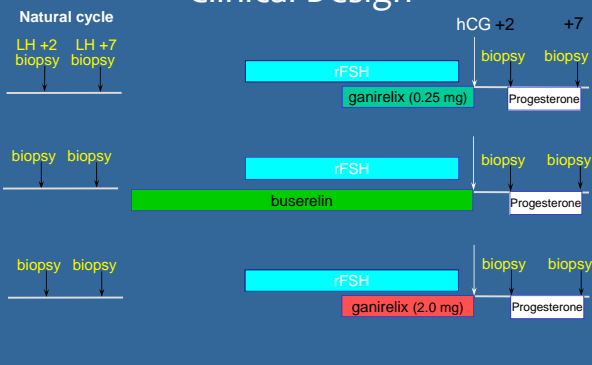

---

---

---

---

### Clinical Design

---

---

---

---

---

---

---

---

### Median # of follicles on the day of hCG All Subjects

---

---

---

---

---

---

---

---

### LH and P rises

LH ≥ 10 IU/L ; P ≥ 1 ng/mL

	prior		during	
	LH rise	LH+P rise	LH rise	LH+P rise
ganirelix 0.25 mg	0	0	0	0
ganirelix 2 mg	1	1	0	0
buserelin	NA	NA	4	4

	Subject	Day	LH value	P value
ganirelix 2 mg	0027	6	31.0	1.2
buserelin	0008	hCG	10.0	1.14
	0014	hCG	10.8	1.25
	0030	hCG	11.0	2.47
	0035	9	13.8	1.01

---

---

---

---

---

---

---

---

---

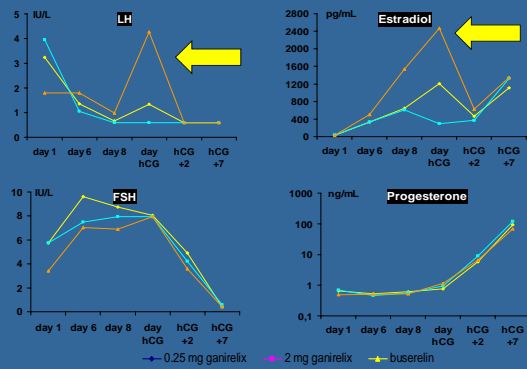

---

---

---

### Median serum hormones

Note: days 1-6-8: subjects with 8 days of recFSH

---

---

---

---

---

---

---

---

---

---

---

---

### Median endometrial thickness

All Subjects

---

---

---

---

---

---

---

SEM evaluation pinopods

Percentage of cells exhibiting any type of pinopods

---

---

---

---

---

---

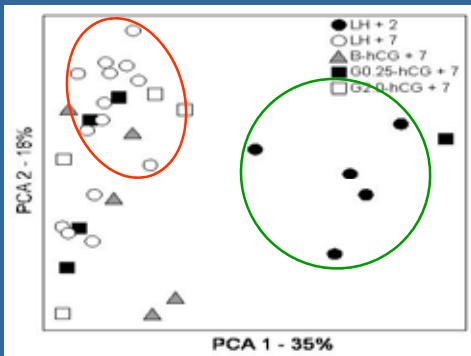

---

---

---

---

Principal Component Analyses of 33 endometrial samples

Using 500 randomly selected genes.

---

---

---

---

---

---

---

---

---

---

Comparison of the microarray (Panel A) and the Q-PCR (Panel B) data for four selected genes

Gene	Average Expression Values				
	Rate of cycle	Busarelin	Octarelin	Octarelin	Octarelin
	LHA2	LHA2	NCG7	NCG7	NCG7
Glycodelin A	64	1002	2707	3119	4494
Glutathione Peroxidase 3	134	1943	1939	2307	3574
Transcortin	41	205	148	138	207
DPP4	147	469	5	14*	41

Negative values indicate absence of expression of this gene as determined by microarray

\* Negative values indicate absence of expression of this gene as determined by microarray

## Clinical applications

### Diagnosis

Gene targeting → Protein analysis

Diagnostic method must be non-invasive and at the time of embryo transfer

Endometrial fluid

---

---

---

---

---

---

---

---

### CONCLUSIONS

- Specific gene pattern can be identified daily in the luteal phase by gene expression analysis.
- Biological pathways regulating the shift from pre to receptive endometrium have been identified.
- There are WOI genes, pathways and biological processes dysregulated in the receptive endometrium in stimulated versus natural cycles.
- The antagonist regimens resembled more closely natural cycles when compared to agonist regimen

---

---

---

---

---

---

---

---

## Future strategies

---

---
