

## Hormonal Markers of Ovarian Reserve

Dr Shanthi Muttukrishna  
EGA UCL Institute for Women's Health  
University College London  
United Kingdom

---

---

---

---

---

---

---

## What is Ovarian Reserve?

The pool (number) of antral follicles in the ovaries that are capable of growing in the presence of gonadotrophins.

---

---

---

---

---

---

---

## Markers of Ovarian Reserve

### *Classical Markers*

Basal FSH/LH (day 2/3)  
Oestradiol

### *New Markers*

Inhibin B  
Anti Mullerian hormone (AMH)  
Antral Follicle count

### *Dynamic tests*

Clomiphene citrate challenge test  
GnRH-analogue stimulation test  
Ovarian Stimulation test

---

---

---

---

---

---

---

## Inhibins

- Inhibins are heterodimeric glycoproteins with dissimilar subunits linked by disulphide bonds.

---

---

---

---

---

---

---

---

## Endocrine role of inhibin in women

---

---

---

---

---

---

---

---

## Inhibin A and B in the Menstrual cycle

---

---

---

---

---

---

---

---

---

---

---

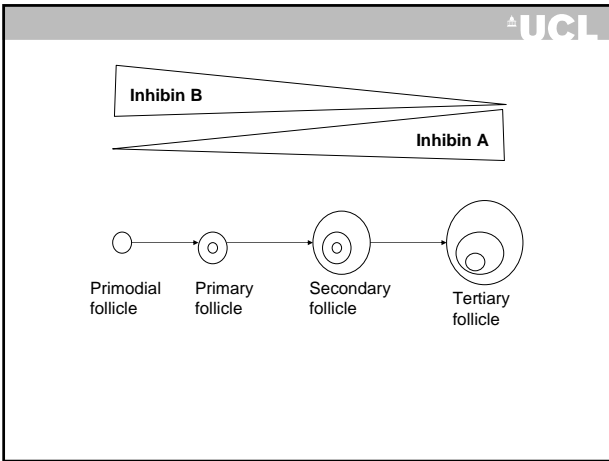

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

## Anti Mullerian Hormone

- AMH is a homodimeric glycoprotein linked by disulphide bonds.
- A member of TGF- $\beta$  family
- Causes regression of the Mullerian ducts during male fetal development
- In females, AMH is produced by granulosa cells of ovarian follicles
- Hormonal control of AMH secretion is unclear

---

---

---

---

---

---

---

---

## AMH

### Possible Functions ?

- AMH may affect the transition of primordial follicles into growing follicles
- AMH may be involved in the recruitment of FSH sensitive follicles in the early antral stage

---

---

---

---

---

---

---

---

**Are AMH and inhibin B useful in predicting ovarian response to gonadotrophin stimulation?**

---

---

---

---

---

---

---

---

### Ovarian Stimulation test

- Retrospective study using samples from 70 patients who had IVF treatment
- Basal blood sample collected on day 3
- Patients were given 300IU/l Gonad F (recombinant FSH) on day 3
- Blood sample was taken on day 4: a day after FSH stimulation

Measurements  
Serum FSH, E2, inhibin B and AMH  
Antral follicle count

Muttukrishna et al 2005 (BJOG, 112:1384-1390)

---

---

---

---

---

---

---

---

### Day 3 FSH vs number of eggs collected

---

---

---

---

---

---

---

---

### Delta E2 (day 4-day 3) vs number of eggs collected

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

Delta inhibin B (day 4-day 3) vs number of eggs collected

---

---

---

---

---

---

---

---

Efficacy of Combined Markers

Markers vs eggs collected/amp FSH	Regression co-efficient	Significance
Day 3 FSH + delta E2	0.37	$P<0.01$
Day 3 FSH + delta E2 + AFC (antral follicle count)	0.7	$P<0.001$
<b>Day 3 FSH + Delta E2 + AFC + delta inhibin B</b>	<b>0.8</b>	<b><math>P&lt;0.001</math></b>
Day 3 FSH + delta E2 + AFC + AMH	0.73	$P<0.001$
AFC + delta inhibin B	0.78	$P<0.001$
<b>AFC + day 3 AMH</b>	<b>0.7</b>	<b><math>P&lt;0.001</math></b>
AFC+ delta inhibin B+ day 3 AMH	0.78	$P<0.001$

---

---

---

---

---

---

---

---

### Conclusion 1

•Antral follicle count is the best single marker of ovarian reserve ( $r=0.67$ ,  $P<0.001$ )

**Problem: It is subjective**

•The best combined markers of ovarian reserve in OST are, AFC + basal FSH + delta E2 + delta inhibin B ( $r=0.8$ ,  $P<0.001$ )

•The best combined basal markers are, AFC + AMH ( $r=0.7$ ,  $P<0.001$ )

---

---

---

---

---

---

---

## Predicting Poor Ovarian response

---

---

---

---

---

---

---

Prospective study: 69 patients recruited

Blood samples: day 5/6 of an untreated menstrual cycle

Hormones measured: FSH, inhibin B and AMH

Outcome: Response to a subsequent gonadotrophin stimulation cycle

Muttukrishna et al, 2004 (BJOG, 111:1248-1253)

---

---

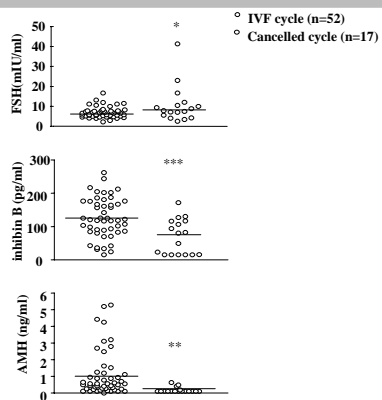

---

---

---

---

---

---

---

---

---

---

---

---

# Predicting Poor Ovarian response

---

---

---

---

---

---

---

---

## Conclusion

AMH is the best single marker to predict poor response in gonadotrophin stimulation

---

---

---

---

---

---

---

---

Recent reviews on the new markers.....

•Verhagen et al, 2008 (Human Reproduction update 14:95:100)

Reviewed 11 studies and concluded that poor response was predicted but not pregnancy rate. Sensitivity of prediction of Poor response:39-97% and specificity:50-96%.

Conclusion: Multivariate models were similar to AFC in predicting ovarian response.

---

---

---

---

---

---

---

## What other factors affect Ovarian reserve?

### Environment ?

•Adult Migrant Bangladeshi's in London have lower levels of salivary progesterone levels compared to white controls living in the same area (Nunez et al, 2007)

### Ongoing prospective study

•Adult migrant women from Bangladesh, White controls and Sedentees living in Bangladesh

•Age 35-55 years

•Blood sample taken day 5/6

---

---

---

---

---

---

---

---

group 1=35-39years  
group 2=40-44years  
group 3=45-49years  
group 4=50-54years  
group 5=55-59years
