

Is diagnostic hysteroscopy an effective tool to increase ART results?

Mr. Tarek El-Toukhy, MSc MD MRCOG
Consultant in Reproductive Medicine and
Surgery,
Guy's and St. Thomas' Hospital,
London

Summary

- ✓ **Technical feasibility and safety**
- ✓ **Effectiveness in ART population**
- ✓ **Hysteroscopy before IVF**
- ✓ **TROPHY Trial**

Technical feasibility

✓ Success rate of standard hysteroscopy:

96% in pre- and post-menopausal population

**97% in pre-menopausal population
(P=0.002)**

Office mini-hysteroscopy

R.Campo¹, Y.Van Belle, L.Rombauts, I.Brosens and S.Gordts

Technical feasibility in 530 infertility patients

98%

Failures	No.	%
Pain	4	0.75
Internal cervical stenosis	3	0.57
Insufficient visualization	5	0.94
Complications	0	
Total	12/530	2.26

Safety

- ✓ **Standard Hysteroscopy:**
1% (16/1399) complication rate (SR of 17 studies)

van Dongen et al, BJOG 2007

Vaso-vagal attack in 13
False track in 2
Fundal perforation in 1

Safety

Mini-hysteroscopy:

0.16%

Table IV. Complications in 4204 conventional office hysteroscopies (1982–1989)

Complications	No.	%
Fundal perforation	2	
Prolonged vagal reaction	4	
Epileptic insult	1	
Infections	0	
Total	7	0.16

R.Campo¹, Y.Van Belle, L.Rombauts, I.Brosens and S.Gordts

Effective Tool?

- ✓ **Reveal pathology**
- ✓ **Normal hsyteroscopy**
- ✓ **Effectiveness is measured by restoration of reproductive potential**

Observer agreement in the evaluation of the uterine cavity by hysteroscopy prior to *in vitro* fertilization

J.C. Kasius^{1,*}, F.J.M. Broekmans¹, S. Veersema², M.J.C. Eijkemans³, Devroey⁵, B.C.J.M. Fauser¹, and H.M. Fatemi⁵

Figure 1 Level of interobserver agreement expressed as ICC¹ before and after discussion between observers. ²ICC, intraclass correlation coefficient (equivalent of the overall weighted κ) (Fleiss and Cohen, 1973). ³For diagnosing the uterine cavity to be normal or abnormal, diagnosing polyps and adhesions, the interobserver agreement significantly increased through discussion ($P < 0.01$). Impossible to compute ICC for diagnosing septa with ordinary statistics, as also used by SPSS version 15.1.

Table II Findings of the hysteroscopy performer at real-time hysteroscopy.

Findings	Prevalence	(%)
Normal cavity	94	87.9
Abnormal cavity	13 ^a	12.1
Polyp	12	11.2
Myoma	1	0.9
Adhesion	0	0.0
Septa	2	1.9
Total	107 ^a	100

^aIn two cases more than one abnormality was detected.

Pathology encountered

- ✓ **Prevalence in ART population 12%-45%
(5000 cases)**

(Campo et al, 1999; Hinckley and Milki, 2004; Karayalcin et al, 2010; Fatemi et al., 2010; Al-Mazny et al., 2010)

- ✓ **Commonest findings:**

- Endometrial polyps
- Submucous fibroids
- Intra-uterine adhesions
- Septate uterus

Outpatient hysteroscopy: a routine investigation before assisted reproductive techniques?

Larger submucous fibroids

204 women with unexplained infertility and submucous fibroids randomised to either

101 hysteroscopic myomectomy

103 diagnostic hysteroscopy

CPR 63.4%

Follow up for 1 year

CPR 28.2%

RR-2.1, 95%CI 1.5-2.9

Shokeir et al, 2010 Fertil Steril

Intrauterine adhesions

✔ No randomised trials

✔ No controlled trials

✔ Case series typically with $N < 100$

Intrauterine adhesions

- ✔ Pregnancy rate ranges between 30-50%
- ✔ Live birth rates range between 10-35%
- ✔ Poor prognostic indicators:
 - Adhesions obliterating both ostia
 - Age >35 years
 - Persistence of amenorrhea
 - Reformation of adhesions at 2nd look

Thompson et al, 2009; Pabuccu et al, 2008; Yu et al, 2008

Endometrial injury: RIF

Review: Local endometrial injury and IVF outcome
 Comparison: 02 Endometrial injury and IVF outcome: RIF
 Outcome: 01 CPR

Biological explanation

- ✓ Release of cytokines and growth factors (LIF, IL-6 and 11, EGF) promoting endometrial development
- ✓ Alternation in endometrial gene expression (Laminin α 4, Integrin α 6, MMP1), which play key roles in implantation
- ✓ Delay endometrial maturation, thus promoting synchronisation with embryo stage

backward
development

Do we need more trials?

- ✔ Small number of randomised trials available
- ✔ Methodological limitations (e.g. no blinding, no allocation concealment)
- ✔ Limited data on LBR

What did the systematic review recommend?

“...Future randomised trials comparing mini-hysteroscopy with no intervention before IVF treatment would be useful”

Outpatient hysteroscopy and subsequent IVF cycle outcome: a systematic review and meta-analysis

Tarek El-Toukhy obtained his medical qualification (MBBCh) in 1991, MSc in 1996 and M in 1998 from the Department of Obstetrics and Gynaecology in Cairo University, Egypt. He was admitted as a member of the Royal College of Obstetricians and Gynaecologists in London in 1998. He then worked as a fellow in Reproductive Medicine in the Assisted Conception Unit at Guy's and St Thomas' Hospital in London between 2000 and 2002. He joined the Assisted Reproductive and Gynaecology Centre in London in 2002. His current research interests are preimplantation genetic diagnosis for genetic disorders and aneuploidy screening.

Abstract

A systematic review of studies evaluating the influence of outpatient (office) hysteroscopy on the outcome of the subsequent IVF cycle was conducted. MEDLINE, Embase, the Cochrane Library, National Research Register, ISI Conference Proceedings, ISRCTN Register and Meta-register were searched for randomized controlled trials (up to July 2007). All trials comparing the outcome of IVF treatment performed in patients who had outpatient hysteroscopy in the cycle preceding their IVF treatment with a control group in which hysteroscopy was not performed were included. Study selection, quality appraisal and data extraction were performed independently and in duplicate. Study authors were contacted for additional information. The main outcome measure was pregnancy rate. In total, 1691 participants were included in two randomized ($n = 942$) and three non-randomized controlled studies ($n = 749$). The quality of the studies was variable. Sub-analysis of the results of five studies showed evidence of benefit from outpatient hysteroscopy in improving the pregnancy rate in the subsequent IVF cycle (pooled relative risk = 1.75, 95% CI 1.51-2.03). The evidence from randomized trials was consistent with that from non-randomized controlled studies. Future, robust randomized trials comparing outpatient hysteroscopy or mini hysteroscopy with no intervention before IVF treatment would be a useful addition to further guide clinical practice.

TROPHY

TRial of OutPatient HYsteroscopy

A multicentre randomised controlled study of the effects of outpatient hysteroscopy on the outcome of the subsequent IVF cycle after recurrent IVF failure. Built with MedSciNet Clinical Trial Framework

TROPHY Trial Protocol

Trophy Collaborators meeting – ESHRE March 2009

TROPHY Trial Protocol

Reproductive Health

Study protocol

Open Access

A multi-centre randomised controlled study of pre-IVF outpatient hysteroscopy in women with recurrent IVF implantation failure:

Trial of Outpatient Hysteroscopy - [TROPHY] in IVF

Tarek El-Toukhy*¹, Rudi Campo², Sesh Kamal Sunkara¹, Yacoub Khalaf¹ and Arri Coomarasamy³

Hypothesis

Does performing an OPH prior to starting an IVF cycle improve the live birth rate in women who have experienced 2-4 failed cycles?

Population

- ✓ **Women under 38, BMI \leq 35**
- ✓ **Failed two-four failed IVF/ET cycles**
- ✓ **Normal TVS of cavity**

Exclusion criteria

- ✓ Age 38 or above
- ✓ Less than 2 or more than 4 failed cycles
- ✓ Fibroids distorting the cavity or untreated hydrosalpinges
- ✓ BMI > 35
- ✓ Recent hysteroscopy (within 2 months)

Intervention

- ✔ Saline OPH (2.9-5mm) - Trophy Scope
- ✔ Cycle before IVF
- ✔ Any standard IVF protocol
- ✔ Any type of FSH/HMG for stimulation

TROPHY scope (Storz) Campo Compact Hysteroscopes

Telepack

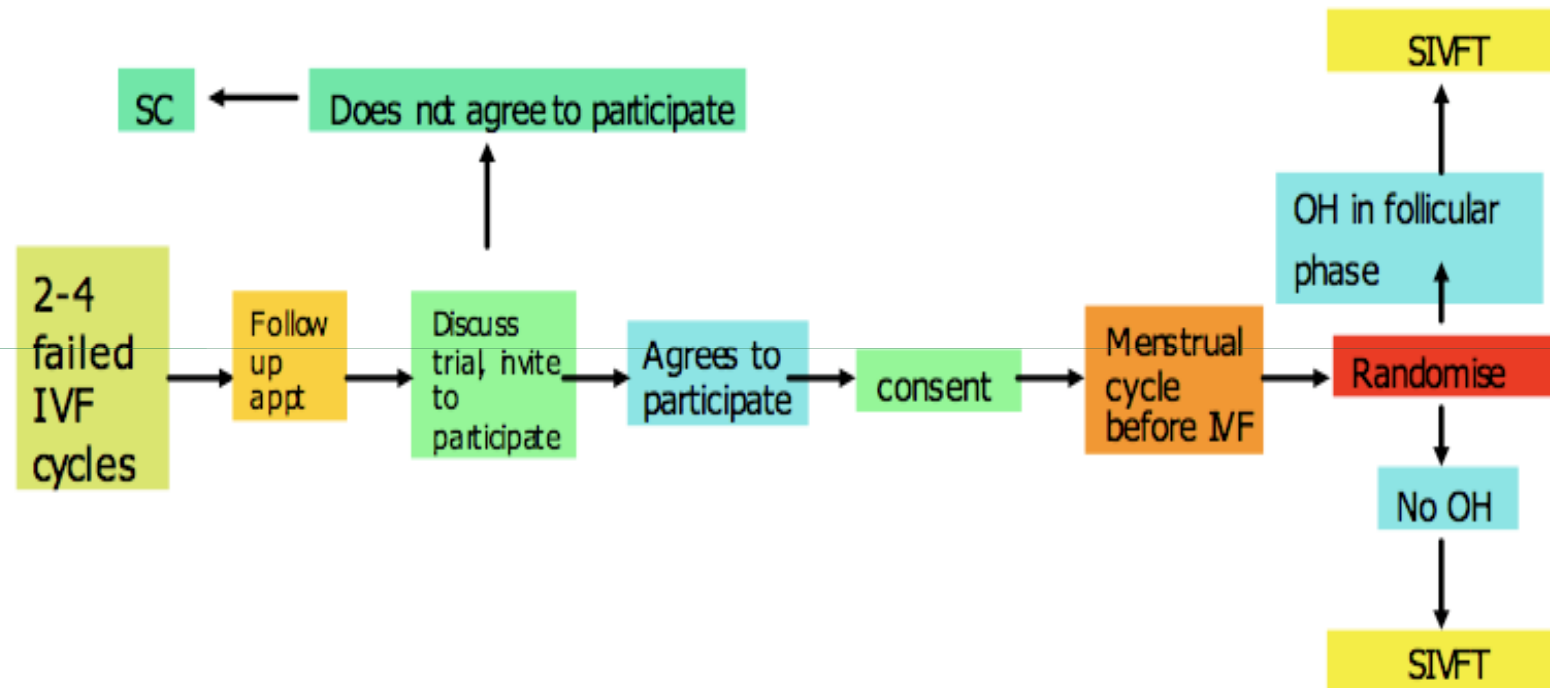

Control group

- ✓ No hysteroscopy
- ✓ Any standard IVF protocol
- ✓ Any type of FSH/HMG for COS

Participant flow in the study

SC=standard care, Appt=appointment, OH= outpatient hysteroscopy, SIVFT=standard IVF treatment

Outcome measures (ITT)

✓ Primary:

- LBR/cycle started

✓ Secondary:

- PR , CPR and IR
- OPH findings
- Adverse effects (including miscarriage rate)
- Health Economic Evaluation

Sample size calculation

- For a DS alpha of 5%
- For a power of 80%
- In order to increase live birth rate from 25% to 35%, need $360 + 360 = 720$ women
- 5% drop out rate = 38

758 (379 in each arm) across
8 European centres

Funding

- ✓ Participating centres
- ✓ ESHRE and EAGE (logistic support)
- ✓ Karl Storz = OPH instruments and training in each of the participating 8 centres
- ✓ Tristel = sterilisation

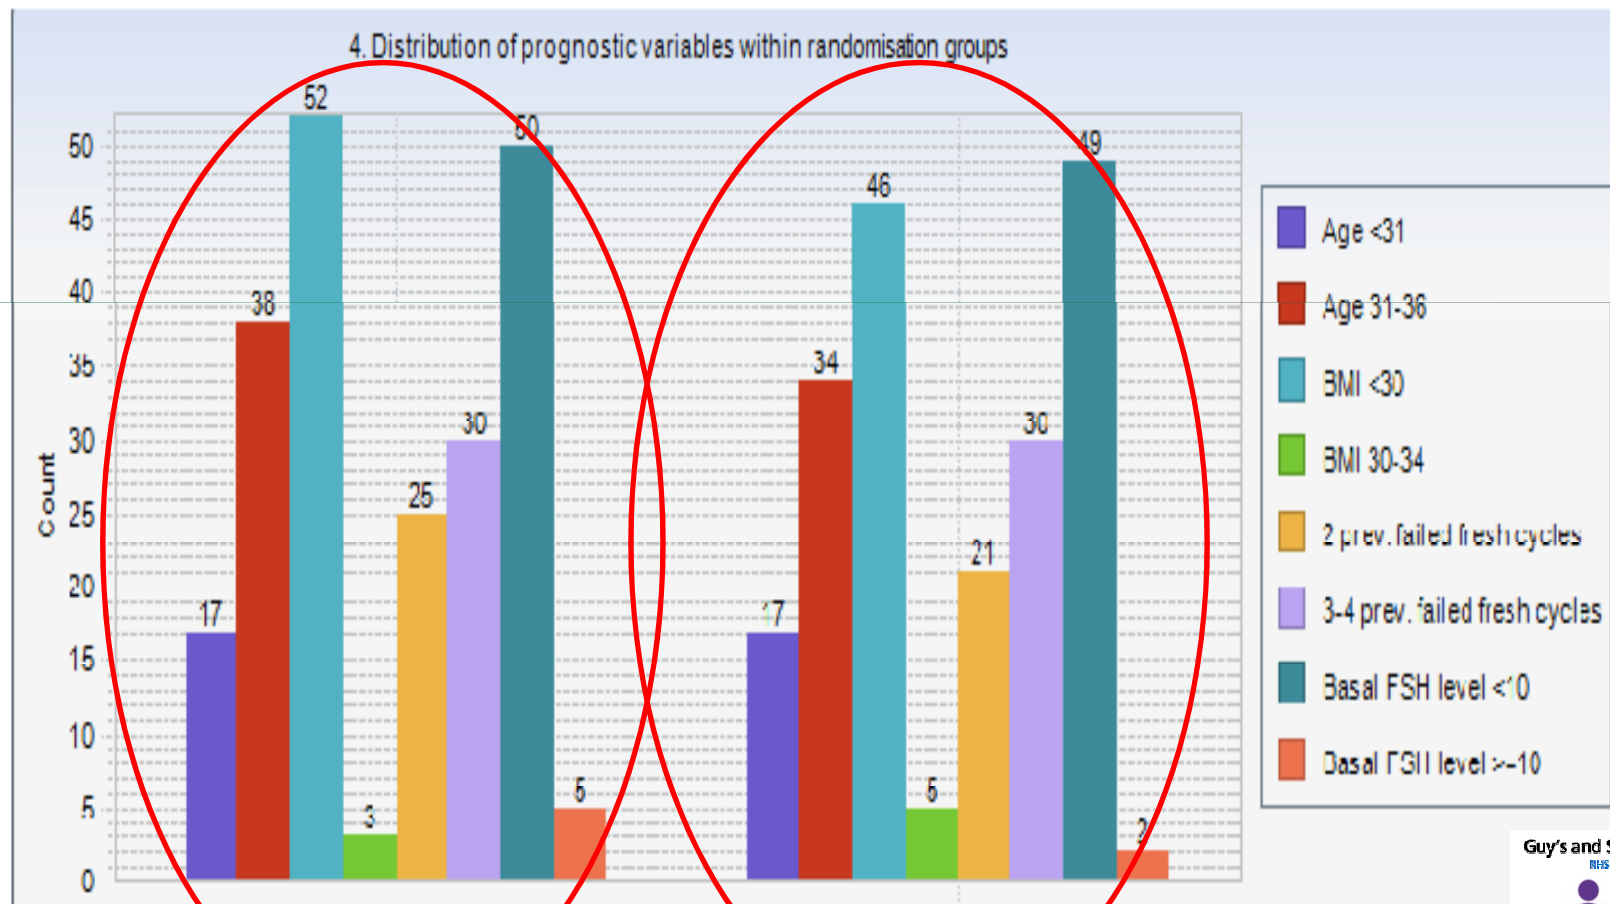

Analysis

- ✓ **Comparative analysis (within study, with patients outside study)**
- ✓ **Minimisation**
 - Age <31, 31-37years
 - BMI <30, 30-34
 - Number of previous failed cycles
 - 2
 - 3-4
 - FSH level
 - <10
 - 10 or more
- ✓ **Adjustments and sensitivity analysis**
 - Logistic regression (hysteroscopy findings: normal, abnormal, control for centre effect)

Prognostic variables

Targets and timelines

- ✓ 450 cases by end of 2011
- ✓ Complete study by mid 2012
- ✓ Publication of LB results in 2013

Conclusions

- ✔ Hysteroscopy is a safe and effective diagnostic and therapeutic tool in ART patients
- ✔ Treatment of intra-uterine pathology can improve ART outcome (Level I-III)
- ✔ Diagnostic Hysteroscopy before IVF is likely to improve outcome in subsequent IVF cycle (Level I)

The future...

- On-going randomised trials will shed more light on the role of routine out-patient hysteroscopy before IVF
