PDE-5 inhibitors: women’s satisfaction

Sant M et al. J Sex Med 2005
The intracavernosal injection therapy
Penile prosthesis
Fertility and potency is particularly strong since the capacity to procreate is essential to the male identity

*Nachtigall RD. et al, 1992; Woollett A., 1985*

More pressure to men since, compared to women, men are not keen to initiate investigation for infertility

*McGrade and Tolor, 1981*
The Wheels of Life
Love story I
The "NOW SEX" story!
“Sexual” myths

- A real man keeps any woman satisfied
- A real man has sexual intercourse any time the situation raises
- A real man doesn’t need much stimulation to get an erection
- A successfully professional career implies control of sexual behavior
- If I fail again, this will be the end!
When a couple has an infertility issue, problems with their sexual relationship may become more pronounced: **The need to "perform" at specific times.**

Sexual activity: an activity restricted for **procreation** rather than **recreation**.

Sexual expression in a couple with infertility becomes **“mechanical and forced.”**

*Siebel MM, and Taymor ML, 1982*

The psychogenic nature of erectile dysfunction in these patients was also evident from its association with a **longer duration of infertility** and with **increased levels of anxiety.**

*Saleh et al., 2003*
Male factor infertility accounts for about 30-40% of all cases seeking fertility treatment.

Compared to women little is known about the impact of emotional stress on the male partner.

The diagnosis of male infertility has been associated with a loss of self-esteem and an increase in patient anxiety and somatic complaints.

Kedem P. et al, 1990
An **emotional crisis** and a physical challenge interferes with one of the most fundamental human activities.

*Mahlstedt PP, 1985*

From a list of 87 items of stressful life events, infertility has been ranked as **one of the most negative stressful situations**—akin to the death of a son or a spouse.

*Dohrenwend and Dohrenwend, 1981*

As it is a major source of life stress, infertility might be associated with sexual dysfunction (SD) through **the erosion of self-esteem and self-confidence**, and by stimulating discord in a relationship.
Men from infertile relationships reported more sexual dysfunction compared with the control group.

Monga et al., 2004
Identification and classification of male infertility relies on the results of **semen analysis**.

The standard procedure to obtain an ejaculate is by **masturbation** since it is the easiest and most practical method, cheap and hygienic, and also allows bacteriological testing if needed.

In the majority of cases, requesting a masturbated sample is therefore **the unquestioned and preferred way** to obtain spermatozoa for all types of diagnostic and therapeutic purpose. (Gerris J., 1999)
The inability to produce seminal specimens at the time of seminal evaluation may reflect difficulties with sexual drive and deficient spermatogenic parameters.

Zavos et al, 1999
Sperm donation
Sperm analysis

Men who masturbate regularly are at a reduced risk of developing prostate cancer.
Masturbation

Men have high levels of anxiety when providing a semen sample either **pre-treatment or on the day of oocyte retrieval** since the procedures involved in providing a specimen were relatively stressful (R.N.Clarke et al., 1999) even due to the clinic visits only (Reading and Gambone, 1998).

1/10 men undergoing infertility evaluation experienced problems with erection or orgasm after detection of an abnormality in the results of their first semen analysis. Because these men had normal sexual functions before the infertility evaluation, it is speculated that erectile dysfunction in these cases was psychogenic in nature and was triggered by the abnormal results of semen analysis. (Saleh et al., 2003)

“We describe for first time the use of sildenafil citrate for temporary ED in couples undergoing ART:

- Husband could not produce spermatozoa for the first IVF treatment after an exhausting trial for 12 h, without previous problems in providing sperm samples during previous IUI cycles.
- Using sildenafil enabled him to provide spermatozoa, but the delay in oocyte insemination resulted in no embryonic development.
- This prompted us to be more alert to this option and to suggest the use of Viagra to men who had a history of ED during previous ART cycles.
- In these cases, the use of Viagra was planned in advance and it successfully solved any unpredictable ED on the day of insemination. Such cases emphasize the need to think in advance of this potential use of Viagra during ART”.

Tur-Kaspa I et al, Hum Reprod. 1999;14(7):1783-4
The use of PDE-5 inhibitors in male infertility diagnostic procedures or/and assisted reproduction programs could be an approach possibly **useful and able to diminish the stress** perceived by men and associated with these techniques when patients (and sperm donors) have to produce a semen sample in the uninviting surroundings of a fertility clinic.

Furthermore, this treatment might **help in maximizing recovery of the best semen**, since a number of studies have indicated that stress has a negative impact on various parameters associated with semen quality, including sperm concentration, motility and morphology (Moghissi and Wallach, 1983; Bents, 1985; Giblin et al., 1988).

The use of PDE-5 inhibitors in general, during medical reproduction management, **could be introduced in cases of male infertility**, providing a patient with a facilitative effect when the patient 'has to' produce a semen sample for analysis, breaking the vicious circle in which diagnostic procedures induce stress, and stressed partners are less fertile and less sexually active (Jannini et al. 2004).
Sex is good for ART couples!

Being sexually active during the IVF-treatment period was found to be positively associated (p < .05) with the likelihood of conception and with adaptive coping strategies."

Bar-Hava et al, 2001

3. Reproductive health and midwives: does occupational status differentiate their attitudes on assisted reproduction technologies from those of the general population?
   Papaharitou S, Nakopoulou E, Moraitou M, Hatzimouratidis K, Hatzichristou D.

A conceptual framework for the evolution of sexual medicine and a model for the development of alternative sexual health services: 10-year experience of the center for sexual and reproductive health.
   J Sex Med. 2009 Sep;6(9):2405-16.
Asking about sexual health...

1. Sexual activity
   - number and gender of a patient’s sexual partners
   - length of the relationship
2. Fertility status / contraception
   - number of children / abortions
   - prevention of pregnancy strategies
   - infertility problems / therapies
3. STDs
   - HIV
   - HPV
   - infections (gonorrhea, chlamydia, etc)
4. Sexual Practices
   - patient and family attitudes
   - sex beliefs / socio-cultural influences
   - self stimulation / masturbation
   - sex practices / variations
5. Sexual experiences
   - sexual development / body image
   - abuse / trauma
6. Sexual problems and satisfaction
   - past (before problem if possible)
   - present

Finishing up question:
“Is there anything else about your sexual life that I need to know about to ensure you good sexual health care?”

The ICSM-5

Man/woman complaining of SD

Step 1
Basic Evaluation

Mandatory:
1. Sexual history
2. Medical history
3. Psychosocial history

Step 2

Findings indicate further specific evaluation

Findings do not preclude treatment

Specialized tests and/or referral

Step 3
Patient / partner education
Shared decision making

Step 4
Treatment

Counseling / Life style modifications
Psychological (cognitive/behavioral/sex therapy)
Medical (pharmacotherapy, devices)
Surgical

Step 5
Evaluation of sexual well-being

Treatment outcome (sexual function/adherence)
Patient / partner / relationship satisfaction
Life satisfaction / QOL
